

Part A:

Between 1st January 2020 and 31st March 2020, Meesho is targeting to acquire 1 lakh transactors while limiting the ad expenditure to 2.5 Crore rupees.

Assuming an install-to-transaction ratio of 10% and current set up of Meesho (app-only with minimal web presence), plan as per your research:

1. Channel-wise expenditure, with expected installs and transactors from the respective channels
2. Campaign set up within the channel

Part B:

After the plan has been made live, the actual cost per install on Facebook channel on app install objective campaigns is 20% higher than the projected cost per install. How do you diagnose the problem and solve it?
